# Identifying Neonatal Abstinence Syndrome (NAS) and Treatment Guidelines

University of Iowa Children's Hospital -11/2014

## What is Neonatal Abstinence Syndrome?

- Neonatal withdrawal after intrauterine exposure to certain drugs (illicit or prescription)
- Occurs with the abrupt cessation of the drug exposure at birth
- Most commonly seen with opioid exposure, but also seen after exposure to sedatives, selective serotonin reuptake inhibitors (SSRI), polysubstance abuse, and occasionally barbiturates and alcohol
- Develops in 55-94% of opioid drug-exposed infants and 28-30% of SSRI-exposed infants

## **Screening**

- Maternal history
- Urine drug screen

- Meconium drug testing
- Umbilical cord testing

### **Clinical Signs of Withdrawal**

Central Nervous System	Metabolism/Vasomotor/Respiratory	Gastrointestinal
<ul> <li>Irritability</li> </ul>	<ul> <li>Diaphoresis</li> </ul>	<ul> <li>Vomiting</li> </ul>
<ul> <li>Increased wakefulness</li> </ul>	<ul> <li>Nasal stuffiness</li> </ul>	<ul> <li>Diarrhea</li> </ul>
<ul> <li>High-pitched cry</li> </ul>	• Fever	<ul> <li>Dehydration</li> </ul>
• Tremor	<ul> <li>Mottling</li> </ul>	<ul> <li>Poor weight gain</li> </ul>
<ul> <li>Increased muscle tone</li> </ul>	<ul> <li>Temperature instability</li> </ul>	<ul> <li>Poor feeding</li> </ul>
<ul> <li>Hyperactive deep</li> </ul>	<ul> <li>Piloerection</li> </ul>	<ul> <li>Uncoordinated and constant</li> </ul>
tendon reflexes	<ul> <li>Mild elevations in respiratory</li> </ul>	sucking
<ul> <li>Frequent yawning</li> </ul>	rate and blood pressure	
<ul> <li>Sneezing</li> </ul>		
<ul> <li>Seizures</li> </ul>		

### Onset of withdrawal symptoms

• Onset of withdrawal depends on the half-life of the drug, duration of the addiction, and time of last maternal dose prior to delivery. On average, observation period for symptoms to appear is 3 days.

Drug	Approximate time to onset of withdrawal symptoms		
Barbiturates	4-7 days but can range from 1-14 days		
Cocaine	Usually no withdrawal signs but sometimes neurobehavioral abnormalities (decreased		
	arousal and physiologic stress) occur at 48-60 hours		
Alcohol	3-12 hours		
Heroin	Within 24 hours		
Marijuana	Usually no clinical withdrawal signs		
Methadone	3 days but up to 5-7 days; rate of severity of withdraw cannot be correlated to dose of		
	maternal methadone		
Methamphetamines	Usually no withdrawal signs but sometimes neurobehavioral abnormalities (decreased		
	arousal, increased physiologic stress, and poor quality of movement) occur at 48-60 hours		
Opioids	24-36 hours but can be up to 5-7 days		
Sedatives	1-3 days		
SSRIs	Usually 2 <sup>nd</sup> day of life—ranges from 5-48 hours		

# Preterm Infants and NAS

• Due to immaturity, less total body fat, and differences in total drug exposure, preterm infants may exhibit fewer signs of withdrawal than near-term and term infants.

Revised: 11/2014; 06/2013; 2/2013 by Sarah Tierney, PharmD. Written: 09/2012 by Sarah Tierney, PharmD UICH Approved: 09/2012 L Vlain MD.

# **Treatment of Neonatal Abstinence Syndrome**

Goal: stabilize clinical manifestations of withdrawal and restore normal newborn activity

# **Scoring of NAS**

- Finnegan scoring (tool to quantify severity of NAS) (See last page for Finnegan Scoring System)
  - o Begin scoring within 3 hours of life
  - o Continue scoring every 3-4 hours to coordinate with feedings and cares
  - Scoring should be done after feeding and nursing cares to eliminate irritability related to normal baby activities
  - Do not wake a sleeping baby to score
- Used to determine initiation of pharmacologic therapy

## Non-Pharmacologic Intervention

- Swaddling
- Rocking
- Minimal sensory or environmental stimulation
- Maintain temperature stability
- Feed (consider alternating bottle and pacifier during feed to compensate for excessive sucking and possibly prevent emesis)
- Breast milk feedings when appropriate can help reduce the need for pharmacological intervention

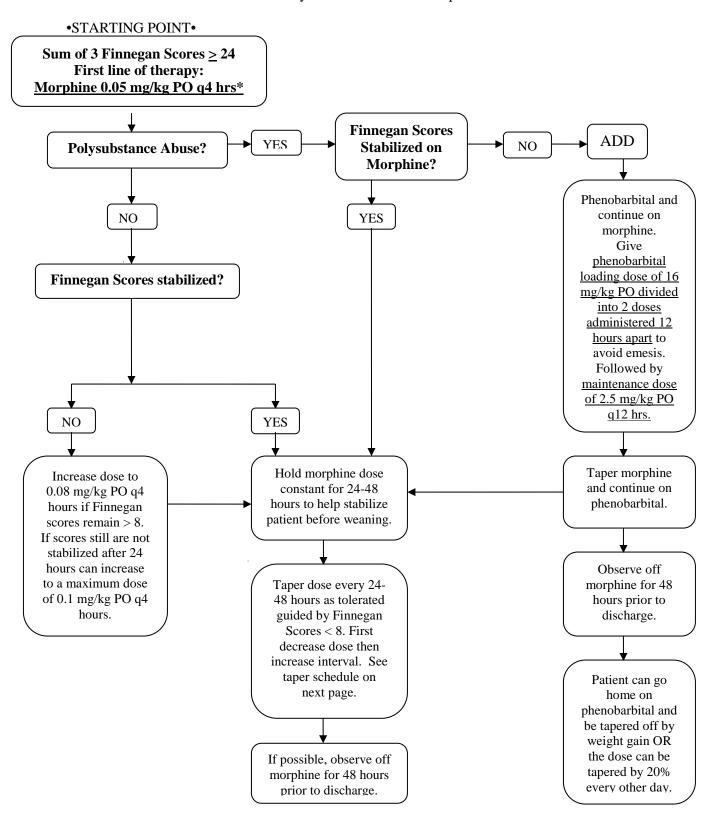

### Pharmacologic Therapy

- Begin when 3 consecutive Finnegan scores are  $\geq 8$  or when the average of two scores OR two consecutive scores is  $\geq 12$ .
- Morphine is the first-line agent and the mainstay of treatment.
- Phenobarbital is the first line additional therapy for polysubstance exposure and may be used in combination with opioid therapy for NAS secondary to opiate withdrawal.
- Opioid-dependency is likely seen after exposure to buprenorphine (Subutex), codeine, heroin, hydrocodone (Lortab, Vicodin), hydromorphone (Dilaudid), methadone, morphine, oxycodone (Percocet).
- Polysubstance-dependency is likely seen with the above drugs as well as barbiturates, sedatives, SSRIs.
- See next page for *Pharmacologic Management of NAS* guidelines.

Revised: 11/2014; 06/2013; 2/2013 by Sarah Tierney, PharmD. Written: 09/2012 by Sarah Tierney, PharmD UICH Approved: 09/2012 L Klein MD.

# Pharmacologic Management of Neonatal Abstinence Syndrome in the NICU

University of Iowa Children's Hospital

\*0.05 mg/kg **PO** is recommended starting dose for NAS

Revised: 11/2014; 06/2013; 2/2013 by Sarah Tierney, PharmD. Written: 09/2012 by Sarah Tierney, PharmD UICH Approved: 09/2012 J Klein MD

# Tapering Schedule (Start this AFTER the patient is stabilized on a dose)

- Dosing on chart is in absolute mgs (NOT mg/kg)
- Find the dose on the chart that is closest to the dose the patient has been stabilized on and start there (this means you may not be starting at the top of the chart)
- Taper dose every 24-48 hours as tolerated, guided by Finnegan Scores of < 8

# Recommended Tapering Schedule AFTER the infant is stabilized on a dose and ready to wean

<b>_</b>	
Morphine TAPERING schedule	Morphine TAPERING schedule
(follow this side for infants $> 3 \text{ kgs}$ )	(follow this side for infants $\leq 3$ kgs)
0.4 mg PO q 4 hrs	0.4 mg PO q 4 hrs
0.3 mg PO q 4 hrs	0.3 mg PO q 4 hrs
0.2 mg PO q 4 hrs	0.2 mg PO q 4 hrs
0.2 mg PO q 6 hrs	0.1 mg PO q 4 hrs
0.2 mg PO q 8 hrs	0.1 mg PO q 6 hrs
0.2 mg PO q 12 hrs	0.1 mg PO q 8 hrs
0.2 mg PO q 24 hrs	0.1 mg PO q 12 hrs
Discontinue	0.1 mg PO q 24 hrs
	Discontinue

### Alternative pharmacological treatment (not first-line at UIHC NICU)

- **Methadone** for opioid-dependency as an alternative to morphine. Dose 0.05 mg/kg PO every 12 hours. Increase by 0.05 mg/kg every 12 hours until NAS scores stabilize. Adverse effects include bradycardia and tachycardia and an ECG should be obtained to evaluate for QT-prolongation. Methadone has an extremely long half-life which can be up to 24 hours in a neonate. Methadone must be tapered by 10-20% per week over 4-6 weeks.
- 2) Clonidine as an alternative to phenobarbital. Clonidine is given in addition to morphine for polysubstance-dependency in term neonates with moderate to severe NAS uncontrolled by morphine alone. Dose 1 mcg/kg PO every 4 hours. Adverse effects include hypotension, rebound hypertension if clonidine is not tapered off over more than a week, AV-block, and bradycardia. MUST taper clonidine off over 10-14 days.

#### Outcomes

Alcohol	Acute ingestion: Hyperactivity, tremors for 72 hours followed by lethargy				
	for 48 hours				
	Chronic ingestion: abnormalities include CNS, growth deficiency, facial				
	features, cardiac and musculoskeletal anomalies.				
Amphetamines	IUGR, cardiac anomalies				
Cocaine	Neurological complications (infarct, IVH, cystic lesions)				
	Higher incidence of prematurity, low birth weight, placental abruption				
	Associated with higher incidence of genitourinary tract and gastrointestinal				
	anomalies				
	Short and/or long term neurobehavioral abnormality				
Heroin	Low birth weight				
Marijuana	Higher incidence of tremors and altered visual responses				
Methamphetamines	IUGR, prematurity, placental abruption, fetal distress, adverse long-term				
	neurotoxic effects on behavior, cognitive skills, and physical dexterity.				
Opioids	Active/passive detoxification results in fetal distress or fetal loss				
	No other adverse outcomes identified so far				
SSRIs	No adverse neurodevelopmental outcomes identified so far				

Revised: 11/2014; 06/2013; 2/2013 by Sarah Tierney, PharmD. Written: 09/2012 by Sarah Tierney, PharmD UICH

**Modified Finnegan Scoring System<sup>7</sup>** 

System	Symptoms	Points	Score	
Central Nervous System	Excessive cry	2		
	Excessive cry (inconsolable)	3		
	Sleep < 1 hour after feeding	3		
	Sleep 1-2 hours after feeding	2		
S	Sleep 2-3 hours after feeding	1		
S	Hyperactive Moro reflex	1		
l B	Marked hyperactive Moro reflex	2
