Crutches and children - standing and walking

Definition
Help your child learn how to stand and walk safely with crutches.

Standing with Crutches
Your child has to be able to balance a little to stand with crutches. Tell your child to hold the head high and look forward, keeping the shoulders back and the stomach and buttocks tucked in. Have your child stand on his good leg. Keep the crutches slightly forward and apart.

Walking with Crutches (No Weight Bearing on Hurt Foot or Leg)
This means that your child cannot put any weight on the hurt foot or leg. The arms, hands, crutches, and good foot are used to move about. Tell your child to:

- Stand on the good foot. Hold the crutches against the side of the body. Squeeze them using the arms and side of body.
- Move the crutches about one step in front, with the crutches out a little wider than his feet. Move the hurt leg forward with the crutches.
- Push down on the crutches with his hands on the handgrips. Squeeze the crutches between the arms and sides.
- Put his weight on the handgrips and move forward.
- DO NOT lean on the crutches on the armpits. Putting weight on the armpits can hurt, and your child can get a rash and damage nerves and blood vessels under his arm.
